Schroth discloses an apparatus with a carrier body having a discrete part engaging outer surface, the outer surface including a generally convex surface and a generally convex recessed portion spaced inwardly. (See Figures 3A, 5, and 6.) The surface is adapted and configured to engage a discrete part having a thickness. The recessed portion having a bottom surface adapted and configured to engage the discrete part and further comprising at least one aperture (74) in the outer surface and extending through the carrier body for communication with a vacuum source. The carrier body is rotatable about an axis normal to the convex surface.
